Health and  
Consumers

# Some ideas on welfare assessment

#1 Animal welfare can't be assessed by using only one indicator

## *Animal welfare: elements to be considered*

---

- Emotions: absence of negative emotional states, such as pain and chronic fear, and presence of positive emotional states
- Adequate biological functioning
- Possibility to express normal behaviour

*(after Duncan and Fraser, 1997)*

## *Animal welfare: elements to be considered (II)*

- The three elements overlap and interact with each other

*(Mason et al, 2001; Mendl, 2001)*

## Piglet:

- Cerebral hypoxia (biological functioning)
- Hunger and pain (emotions)
- Death

## Sow:

- Nest-building (behaviour)
- Stress (biological functioning)

(Cronin et al., 1993)

# Some ideas on welfare assessment

#2 Indicators have to be:

- Valid
- Reliable
- Feasible

# Some ideas on welfare assessment

#2 Indicators have to be:

- Valid-the indicator tells us something about welfare e.g. a change in the indicator reflects an increase / decrease in welfare

- Reliable

- Feasible

# Some ideas on welfare assessment

#2 Indicators have to be:

- Valid
- Reliable-inter-observer reliability and intra-observer reliability
- Feasible

# Some ideas on welfare assessment

#2 Indicators have to be:

- Valid
- Reliable
- Feasible-time & money

# Some ideas on welfare assessment

#2 Indicators have to be:

- Valid
- Reliable
- Feasible

Are cytokines valid, reliable and feasible?

What about cortisol?

**Acute phase proteins**

↑ + APP      ↓ - APP

*(Gruys et al., 2005)*

# Some ideas on welfare assessment

#3 There can be animal-based and resource-based indicators

# Some ideas on welfare assessment

#3 Animal-based indicators give us direct information on the animals' state and can be used across systems and conditions

Example: stocking density

## Floor area requirements (100 Kg. BW)

Aprox. 0.4 m<sup>2</sup>

Aprox. 1 m<sup>2</sup>

*(Petherick and Baxter, 1981)*

# Recommended space allowance –thermoneutral conditions

<b>BW (Kg.)</b>	<b>Space per animal (m<sup>2</sup> )</b>
< 10	0.16 (0.15)
10 - 20	0.28 (0.20)
★ 20 - 30	0.36 (0.30)
★ 30 - 50	0.50 (0.40)
★ 50 - 85	0.72 (0.55)
85 - 110	0.85 (0.65)

# Recommended space allowance – heat stress

BW (Kg.)	Space per animal (m <sup>2</sup> )
< 10	0.22 (0.15)
10 - 20	0.35 (0.20)
20 - 30	0.46 (0.30)
30 - 50	0.65 (0.40)
50 - 85	0.92 (0.55)
85 - 110	1.10 (0.65)

# It is more complicated:

Heat stress depends on effective temperature and this is affected by:

Air temperature

Floor

Ventilation

# And even more so!:

Recommended stocking density also depends on:

Health status

Group size

# Some ideas on welfare assessment

#3 Animal-based indicators give us direct information on the animals' state and can be used across systems and conditions

Example: presence of rooting material-tail biting

# Tail-biting in fattening pigs

---

- Multifactorial problem
- Likely to start as redirected rooting behaviour
- Other risks factors have been described

*(SCAHAW, 1997; Moinard et al., 2003)*

# Some risk factors for tail-biting

---

- Poor health status
- High stocking density (more than 110 Kg / m<sup>2</sup>)
- Partially or fully slatted floor
- More than 5 pigs per feeding space

# ***REDIRECTED ROOTING BEHAVIOUR***

In natural conditions, pigs spend 50% of their active time rooting

# ***REDIRECTED ROOTING BEHAVIOUR***

**GOOD HEALTH**

**TAIL BITING**

**Tail biting (%)**

**Lack of environmental stimulation**

**High densities**

**Thermal stress**

**MISDIRECTED  
FORAGING BEHAVIOUR**

**COMPETITION AND  
FRUSTRATION**

**Mid growing period**

**OUTBREAK  
TAIL BITING**

# Some ideas on welfare assessment

#4 Resource-based indicators are also needed

Lack of animal-based indicators

Selection of improvement strategies

# Some ideas on welfare assessment

#5 Indicators have to be combined into protocols or monitoring systems

# Why on-farm welfare monitoring systems?

To identify animal welfare problems on a given farm

To assess the effectiveness of improvement strategies

To provide information to consumers and other stakeholders

	<p><b>Welfare Quality</b> is an EU funded project about integration of animal welfare in the food quality chain: from public concern to improved welfare and transparent quality.</p> <p>Animal welfare is of considerable importance to European consumers. Nowadays food quality is not only determined by the overall nature and safety of the end product but also by the perceived welfare status of the animals from which the food is produced. This project aims to accommodate societal concerns and market demands, to develop reliable on-farm monitoring systems, product information systems, and practical species-specific strategies to improve animal welfare. Thirtynine institutes and universities (representing thirteen European countries) with specialist expertise participate in this integrated research project. The project started in May 2004 and will take five years to complete.</p> <p>Italian text: <a href="#">WQ text in Italian language</a></p> <p>Spanish text: <a href="#">WQ text in Spanish language</a></p>	<p><b>Information on</b> Project overview FAQ Calendar Research and results</p> <p><b>Information for</b> Consumers Retailers Agricultural producers Policy makers Researchers Media</p> <p><b>Poll</b> Your opinion on...</p>

# The Five Freedoms

---

- Freedom from thirst, hunger and malnutrition
- Freedom from thermal and physical discomfort
  - Freedom from pain, injury and disease
- Freedom to express normal patterns of behaviour
  - Freedom from fear and distress

*(FAWC, 1992)*

## *The Welfare Quality® four principles*

---

- Are the animals properly fed and supplied with water?
- Are the animals properly housed?
- Are the animals healthy?
- Does the behaviour of the animals reflect optimized emotional state?

# INTEGRATION OF PARAMETERS IN AN OVERALL ASSESSMENT

## 4 PRINCIPLES

## 12 CRITERIA

## PARAMETERS

### Good Feeding

1. Absence of prolonged hunger

2. Absence of prolonged thirst

3. Comfort around resting

4. Thermal Comfort

5. Ease of movement

6. Absence of injuries

7. Absence of disease

8. Absence of pain induced  
by management procedures

9. Expression of social behaviours

10. Expression of other behaviours

11. Good Human-Animal relationship

12. Positive emotional state

Body condition score

Water supply

Bursities, Manure on the body

Shivering, Panting, Huddling  
Temperature

Space allowance

Wounds, Lameness, Tail biting

Respiratory and enteric problems  
Skin condition, Hernias  
Criteria of euthanasia

Castration  
Tail docking

Positive & Negative social behaviours

Exploratory behaviour

Human-animal relationship test

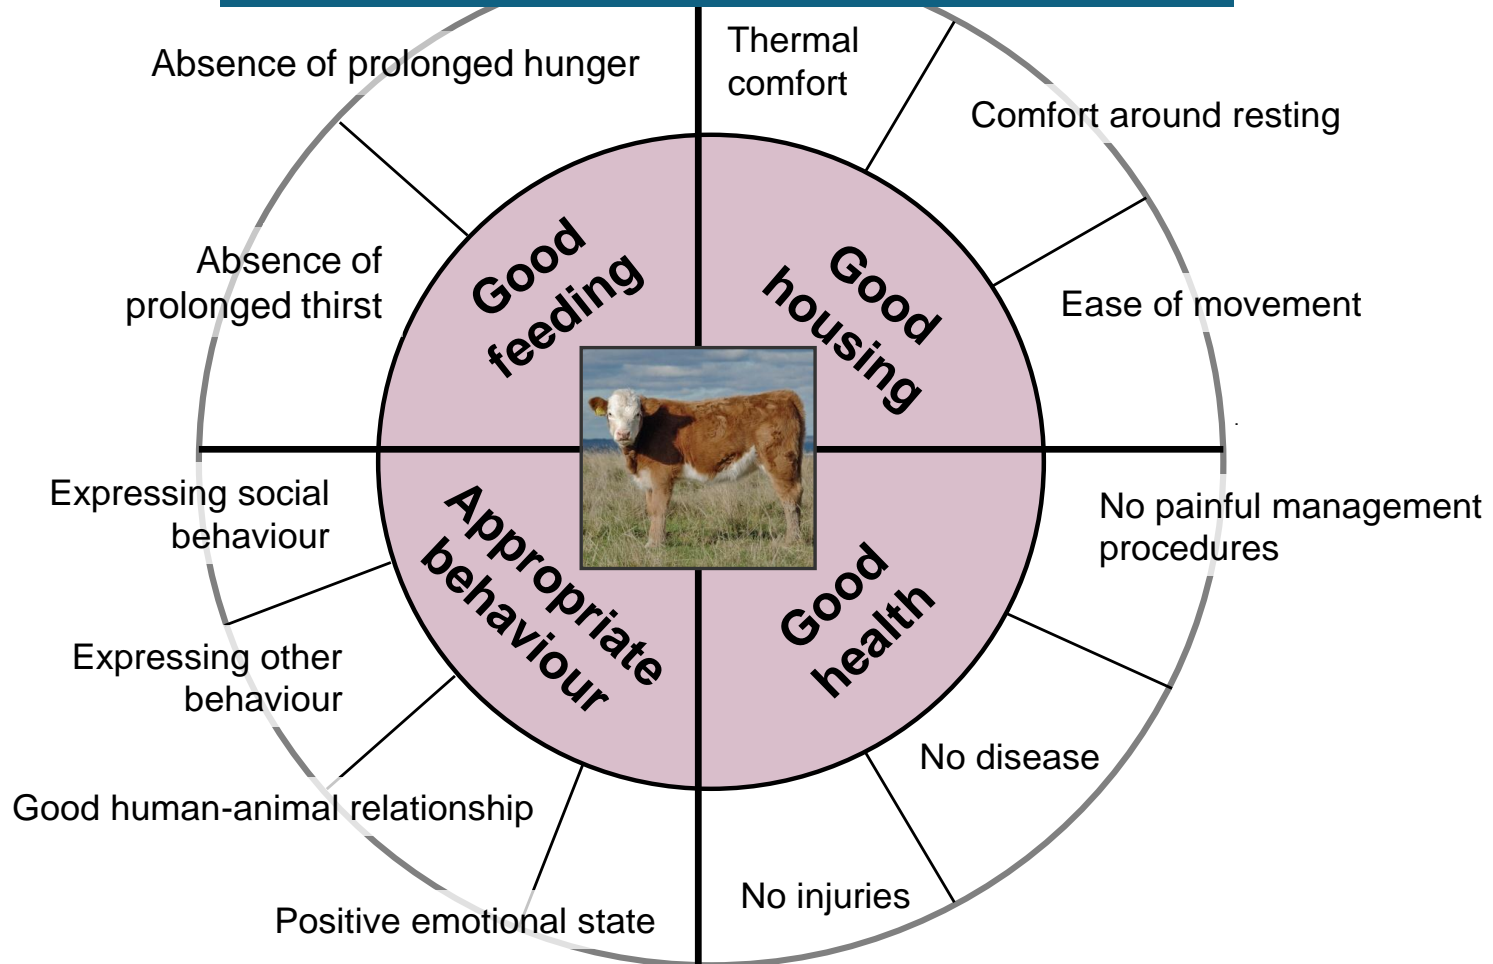

Qualitative Behaviour Assessment

### Good Housing

### Good Health

### Appropriate Behaviour

## Four principles and 12 criteria

- Wounds
- Scratches
- Location

# Some ideas on welfare assessment

#6 Animal-based indicators can be of several types:

Appearance of the animal

Health

Behaviour

Physiology

Production

Carcass / Meat-quality

# Some ideas on welfare assessment

#6 Animal-based indicators can be of several types, but mainly...

Appearance of the animal

Health

Behaviour

(Carcass / Meat-quality)

# Some ideas on welfare assessment

#6 What are the problems with physiology / production?

## Feed intake after weaning

(Robertson et al., 1985)

# Feed intake after weaning

(Pluske, 1993)

## Feed intake after weaning

Growth (g/day) during the first week after weaning

(Pollmann, 1993)

# Some ideas on welfare assessment

#7 Integration of the different indicators to obtain a final value (“overall welfare”) is difficult

# Methodology to integrate welfare measures into an overall assessment
